Abstract—Larvae of three species of the weevil genus *Ceutorhynchus* (*C. subtilirostris* Schultze., *C. viator* Faust, and *C. setosellus* Voss) are described from Middle Asia for the first time. The larvae differ in the shape of frons, structure of the labrum, and chaetotaxy of the epicranium, frons, and lacinia. A key to the species described is given.
